1. Droplet deposition apparatus comprising:
a fluid chamber having actuator means actuatable by electrical signals to
5 effect ejection of droplets from the fluid chamber through a nozzle;
drive circuit means for supplying the electrical signals to the actuator
means; and
conduit means for conveying droplet fluid to and from said fluid
chamber, said drive circuit means being in substantial thermal contact with said
10 conduit means so as to transfer a substantial part of the heat generated in said
drive circuit to said droplet fluid.

6. Droplet deposition apparatus comprising:
at least one droplet ejection unit comprising a plurality of fluid chambers,
15 actuator means and a plurality of nozzles arranged in a row, said actuator
means being actuatable to eject a droplet of fluid from a fluid chamber through a
respective nozzle; and
a support member for said at least one droplet ejection unit, said support
member comprising at least one droplet fluid passageway communicating with
20 said plurality of fluid chambers and arranged so as to convey droplet fluid [to or]
from said fluid chambers in a direction substantially parallel to said nozzle row
and to transfer a substantial part of the heat generated during droplet ejection
to said conveyed droplet fluid.
